Dear Automation Work as a team,

I am applying for the Python development intern role. I am a Python Backend Engineer based in Berlin with experience building Django/FastAPI APIs, backend services, automation workflows, dashboards, and AI/product integrations.

This role stood out because the posting shows Python/backend relevance (Python) and appears potentially compatible with my location/work setup: unclear. I can work legally in Germany without sponsorship and I am comfortable working in English-speaking remote or distributed teams.

My recent work includes backend/API development, integration work, debugging, code review, and building practical automation/product systems. I am strongest where the job needs someone who can turn product requirements into reliable Python services, integrate APIs, work with databases, and keep implementation practical rather than over-engineered.

I have attached a resume tailored toward this role. I would be happy to discuss how my Python/backend and automation experience fits your team.

Best regards,  
Hassan Raza
